

Toward a Framework for Assessing Human-Systems Integration (HSI)

HSI balances human capabilities and limitations with the strengths and weaknesses of system technology to accomplish system goals.

Step One: Briefing

Re-framing the discussion...

This is how HSI is affecting your system

Step Two: Anchoring

Performance	...
Efficiency	...
Reliability	...
Availability	...

Example question for the operator: "What kind of performance accommodation would you make to be ready to respond to the query?"

Step Six: Analysis

Step Five: Collection and Assessment

Step Four: Socialization

Assess 4 Key:

- ✓ Framework for anchoring HSI
- ✓ Overview of HSI measures
- ✓ Range of acceptable performance

Step Three: Calibration

What's next?

- ✓ thesis / initial concept (FY 14)
- ✓ conceptualize domain scales (FY 15)
- ✓ draft domain criteria & TTX scale
- ✓ calibration / TTX (FY15)
- ✓ draft program (FY 16)
- ✓ beta test (FY 16)
- ✓ authorization / software scaling

Human-Systems Integration

NASA Task Load Index
Hart and Staveland's NASA Task Load Index (TLX) method assesses work load on five 7 point scales. Increments of high, medium and low estimates for each point result in 21 gradations on the scales.

Name	Task	Date

Mental Demand How mentally demanding was the task?
Very Low Very High

Physical Demand How physically demanding was the task?
Very Low Very High

Step Two: Anchoring

CHIEF		Coast Guard Acquisition Lifecycle Phase				
What is the implication of HFE on total system performance given what we know about the system?		Project ID (Needs)	Analyze/Select (Preliminary Design)	Obtain (pre CDR) (Detailed Design)	Obtain (Post CDR) (Prototype/LRIP)	Produce, Deploy, Support (Full-rate Production)
5	Optimizing: Impacts on total system performance are consistently positive with no exceptions predicted or observed. Engineering changes driven by inadequate human system integration are very unlikely given current system configuration. Human-system performance is at or above objective-level requirements.	[To be Developed]	Based on the preliminary design: [Anthropometrics] At least 99% of users accommodated across all critical tasks modeled; less than 1 in 100 users are not accommodated in the preliminary system design. [Workload] Workload insignificant. Enough spare capacity for all desirable additional tasks. [Time on Task] Time on task is predicted to be less than specified objective value (better than objective requirement) for requisite manpower, across all mission-critical tasks. [Spatial Analysis] No measurable performance degradation noted for either non-critical or mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human error] Human error predicted to occur in 1 in 100 critical tasks.	Based on the detailed design: [Anthropometrics] At least 99% of users accommodated across all critical tasks modeled; less than 1 in 100 users are not accommodated in the preliminary system design. [Workload] Workload insignificant. Enough spare capacity for all desirable additional tasks. [Time on Task] Time on task is predicted to be less than specified objective value (better than objective requirement) for requisite manpower, across all mission-critical tasks. [Spatial Analysis] No measurable performance degradation noted for either non-critical or mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human error] Human error predicted to occur in 1 in 100 critical tasks.	Based on the prototype/LRIP system: [Anthropometrics] At least 99% of users accommodated across all critical tasks modeled; less than 1 in 100 users are not accommodated in the preliminary system design. [Workload] Workload insignificant. Enough spare capacity for all desirable additional tasks. [Time on Task] Time on task is predicted to be less than specified objective value (better than objective requirement) for requisite manpower, across all mission-critical tasks. [Spatial Analysis] No measurable performance degradation noted for either non-critical or mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human error] Human error predicted to occur in 1 in 100 critical tasks.	Based on the production system: [Anthropometrics] At least 99% of users accommodated across all critical tasks modeled; less than 1 in 100 users are not accommodated in the preliminary system design. [Workload] Workload insignificant. Enough spare capacity for all desirable additional tasks. [Time on Task] Time on task is predicted to be less than specified objective value (better than objective requirement) for requisite manpower, across all mission-critical tasks. [Spatial Analysis] No measurable performance degradation noted for either non-critical or mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human error] Human error predicted to occur in 1 in 100 critical tasks.
4	Enhancement: Impacts on total system performance are net positive with rare or insignificant exceptions. Engineering changes driven by inadequate human system integration are unlikely. Human-system performance is well above threshold-level requirements, but has not met objective-level requirements.	[To be Developed]	Based on the preliminary design: [Anthropometrics] At least 95% of users accommodated across all critical tasks modeled; less than 1 in 50 users are not accommodated in the preliminary system design. [Workload] Workload low. Ample spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet objective requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Rare or insignificant performance degradation of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 5 in 100 critical tasks.	Based on the detailed design: [Anthropometrics] At least 95% of users accommodated across all critical tasks modeled; less than 1 in 50 users are not accommodated in the preliminary system design. [Workload] Workload low. Ample spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet objective requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Rare or insignificant performance degradation of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 5 in 100 critical tasks.	Based on the prototype/LRIP system: [Anthropometrics] At least 95% of users accommodated across all critical tasks modeled; less than 1 in 50 users are not accommodated in the preliminary system design. [Workload] Workload low. Ample spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet objective requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Rare or insignificant performance degradation of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 5 in 100 critical tasks.	Based on the production system: [Anthropometrics] At least 95% of users accommodated across all critical tasks modeled; less than 1 in 50 users are not accommodated in the preliminary system design. [Workload] Workload low. Ample spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet objective requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Rare or insignificant performance degradation of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 5 in 100 critical tasks.
3	Minimal Degradation: Impacts on total system performance trend slightly toward degradation. Engineering changes driven by inadequate human system integration may emerge during sustainment to remedy minor system performance deficiencies. Human-system performance (time on task, error rates, availability, etc.) is marginally meeting threshold requirements.	[To be Developed]	Based on the preliminary design: [Anthropometrics] At least 90% of users accommodated across all critical tasks modeled; roughly 1 in 20 users are not accommodated in the preliminary system design. [Workload] Workload comfortable. Reduced spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet threshold requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Minimal performance degradation noted of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 10 in 100 critical tasks.	Based on the detailed design: [Anthropometrics] At least 90% of users accommodated across all critical tasks modeled; roughly 1 in 20 users are not accommodated in the preliminary system design. [Workload] Workload comfortable. Reduced spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet threshold requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Minimal performance degradation noted of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 10 in 100 critical tasks.	Based on the prototype/LRIP system: [Anthropometrics] At least 90% of users accommodated across all critical tasks modeled; roughly 1 in 20 users are not accommodated in the preliminary system design. [Workload] Workload comfortable. Reduced spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet threshold requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Minimal performance degradation noted of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 10 in 100 critical tasks.	Based on the production system: [Anthropometrics] At least 90% of users accommodated across all critical tasks modeled; roughly 1 in 20 users are not accommodated in the preliminary system design. [Workload] Workload comfortable. Reduced spare capacity for additional tasks. [Time on Task] Time on task is predicted to meet threshold requirement for requisite manpower, across all mission-critical tasks. [Spatial Analysis] Minimal performance degradation noted of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 10 in 100 critical tasks.
2	Moderate Degradation: Impacts on total system performance are consistently degrading with measurable effect on critical mission performance. Engineering changes driven by inadequate human system integration are likely to emerge during early prototype testing or very early in the sustainment phase. Human-machine performance (time on task, error rates, availability, etc.) are appreciably below threshold requirements.	[To be Developed]	Based on the preliminary design: [Anthropometrics] At least 85% of users accommodated across all critical tasks modeled; roughly 3 in 20 users are not accommodated in the preliminary system design. [Workload] Very high workload with very little spare capacity. Difficulty in maintaining level of effort. [Time on Task] Time on task is predicted to exceed threshold requirement for one or more mission-critical tasks by up to 10%. [Spatial Analysis] Measurable performance degradation noted for critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 15 in 100 critical tasks.	Based on the detailed design: [Anthropometrics] At least 85% of users accommodated across all critical tasks modeled; roughly 3 in 20 users are not accommodated in the preliminary system design. [Workload] Very high workload with very little spare capacity. Difficulty in maintaining level of effort. [Time on Task] Time on task is predicted to exceed threshold requirement for one or more mission-critical tasks by up to 10%. [Spatial Analysis] Measurable performance degradation noted for critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 15 in 100 critical tasks.	Based on the prototype/LRIP system: [Anthropometrics] At least 85% of users accommodated across all critical tasks modeled; roughly 3 in 20 users are not accommodated in the preliminary system design. [Workload] Very high workload with very little spare capacity. Difficulty in maintaining level of effort. [Time on Task] Time on task is predicted to exceed threshold requirement for one or more mission-critical tasks by up to 10%. [Spatial Analysis] Measurable performance degradation noted for critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 15 in 100 critical tasks.	Based on the production system: [Anthropometrics] At least 85% of users accommodated across all critical tasks modeled; roughly 3 in 20 users are not accommodated in the preliminary system design. [Workload] Very high workload with very little spare capacity. Difficulty in maintaining level of effort. [Time on Task] Time on task is predicted to exceed threshold requirement for one or more mission-critical tasks by up to 10%. [Spatial Analysis] Measurable performance degradation noted for critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 15 in 100 critical tasks.
1	Severe Degradation: Unacceptable impact on mission performance. Accomplishment of key mission functions or tasks are severely degraded or precluded due to an unsafe or operationally ineffective system configuration. Engineering changes driven by inadequate human-machine integration are required for continued program viability.	[To be Developed]	Based on the preliminary design: [Anthropometrics] Less than 85% of users accommodated across all critical tasks modeled; roughly 3 in 10 users are not accommodated in the preliminary system design. [Workload] Excessive workload. Unable to apply sufficient mental effort. No spare capacity. [Time on Task] Time on task is predicted to exceed threshold requirement for multiple mission-critical tasks, or by more than 10%. [Spatial Analysis] Severe performance degradation noted for one or more mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in more than 15 in 100 critical tasks.	Based on the detailed design: [Anthropometrics] Less than 85% of users accommodated across all critical tasks modeled; roughly 3 in 10 users are not accommodated in the preliminary system design. [Workload] Excessive workload. Unable to apply sufficient mental effort. No spare capacity. [Time on Task] Time on task is predicted to exceed threshold requirement for multiple mission-critical tasks, or by more than 10%. [Spatial Analysis] Severe performance degradation noted for one or more mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in more than 15 in 100 critical tasks.	Based on the prototype/LRIP system: [Anthropometrics] Less than 85% of users accommodated across all critical tasks modeled; roughly 3 in 10 users are not accommodated in the preliminary system design. [Workload] Excessive workload. Unable to apply sufficient mental effort. No spare capacity. [Time on Task] Time on task is predicted to exceed threshold requirement for multiple mission-critical tasks, or by more than 10%. [Spatial Analysis] Severe performance degradation noted for one or more mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in more than 15 in 100 critical tasks.	Based on the production system: [Anthropometrics] Less than 85% of users accommodated across all critical tasks modeled; roughly 3 in 10 users are not accommodated in the preliminary system design. [Workload] Excessive workload. Unable to apply sufficient mental effort. No spare capacity. [Spatial Analysis] Severe performance degradation noted for one or more mission-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in more than 15 in 100 critical tasks.

Form V4 - Updated 1/30/16

Instructions: For the appropriate acquisition phase, select the block that describes the current state of performance for the selected HFE measures. If all performance criteria are not met, select the next lower block.

Example question for the practitioner: "What level of anthropometric accommodation would you consider 'minimally acceptable' for this system?"

Minimal Degradation: Impacts on total system performance trend slightly toward degradation. Engineering changes driven by inadequate human system integration may emerge during sustainment to remedy minor system performance deficiencies. Human-system performance (time on task, error rates, availability, etc.) is marginally meeting threshold requirements.

Moderate Degradation: Impacts on total system performance are

	<p>degradation of critical/non-critical tasks due to workstation layout, workspace design, system physical configuration. [Human Error] Human error predicted to occur in 5 in 100 critical tasks.</p>	<p>de de to</p>
